

Measles Preparedness for Child Care and Early Learning

Measles Information

Measles continues to spread in the U.S. and in Washington state. Most measles cases come from people who do not have the recommended number of measles, mumps, and varicella (MMR) vaccinations.

Early learning and child care providers should prepare in case of a measles event in the community.

- **Identify your Local Health Jurisdiction contact (Local Health Department)**

Keep contact information for your [Local Health Jurisdiction](#) (LHJ) up to date. Reach out now if you don't have a contact. Contact the LHJ if there is a suspected case of measles in the building. The LHJ coordinates the response as directed by the Local Public Health Officer. They will determine if children, staff or volunteers need to be excluded. In some cases, they may require additional doses of MMR vaccine. For more information, see [WAC 246-110-020](#).

- **Create or update measles susceptible lists**

A measles susceptible list identifies all children, volunteers, and staff who do not have immunity to measles. Be prepared to quickly access this list in the event of a measles exposure at your facility.

Valid proof of immunity includes:

- Records documenting measles vaccination.
 - Children ages 1 to 3 years with one MMR vaccination
 - Children ages 4 years or older with 2 MMR vaccinations
 - Adults with one MMR vaccination
 - Note: The local public health officer may require individuals with only one MMR vaccine to get a second dose to return to their normal daily activities (child care, school or work).
 - Immunity to measles from a laboratory titer test.
 - Laboratory testing showing measles infection.
 - People born before 1957.
- **Prepare a list of susceptible children:**
 - Use the School and Child Care Immunization Module (SCCIM) At Risk Report (the training guide is linked below). **OR**
 - Create a list by referring to required immunization paperwork and using the Outbreak Susceptible List template in [Word](#) or [Excel](#).
 - **Prepare your personnel:** [State law](#) requires licensed child care centers and early learning programs to collect measles immunity documentation from staff and volunteers who supervise children. If your facility hasn't collected this information, inform your staff and volunteers they need to show proof of immunity to measles. Track measles immunity using the [staff immunization history template in Word](#).
